DIMMING FUNCTION

The function inside the motion sensor for tri-level control, for areas that require a light change before switch-off. The sensor has 3 levels of light: 100%, dimmed light (when natural light is insufficient) and off. Selectable waiting time; motion hold-time and stand-by period; selectable daylight threshold and freedom of detection area.

With sufficient natural light, the light does not switch on when presence is detected.

With insufficient natural light, the sensor switches on the light automatically when presence is detected.

After hold-time, the light dims to stand-by level if the surrounding natural light is below the daylight threshold.

Light switches off automatically after the stand-by period elapses.
